Task 1: Display Pixel Density (PPI/DPI) Calculator

```
"""
Task 1: Display Pixel Density (PPI/DPI) Calculator
HCI & Computer Graphics Lab 1
"""

import math

def calculate_dpi(wpx, hpx, diagonal_inches):
    """
    Calculate DPI using the diagonal pixels and physical diagonal size
    Formula:  $DPI = \sqrt{W^2 + H^2} / D\_inches$ 
    """
    diagonal_pixels = math.sqrt(wpx**2 + hpx**2)
    dpi = diagonal_pixels / diagonal_inches
    return dpi

def classify_density(dpi):
    """
    Classify display density based on DPI value
    """
    if dpi < 100:
        return "Low Density (Standard Monitor)"
    elif 100 <= dpi <= 200:
        return "Medium Density (HD Display)"
    else:
        return "High Density (Retina / Mobile)"

def calculate_aspect_ratio(wpx, hpx):
    """
    Calculate simplified aspect ratio using GCD
    """
    gcd = math.gcd(wpx, hpx)
    return f"{wpx//gcd}:{hpx//gcd}"

def dpi_calculator():
    """Main function to run the DPI calculator"""

    print("="*60)
    print("DISPLAY PIXEL DENSITY (DPI/PPI) CALCULATOR")
    print("="*60)
    print()
```

```

# Get user input
wpx = int(input("Enter horizontal resolution (pixels): "))
hpx = int(input("Enter vertical resolution (pixels): "))
diagonal_inches = float(input("Enter physical diagonal size (inches): "))

# Calculate metrics
total_pixels = wpx * hpx
aspect_ratio = calculate_aspect_ratio(wpx, hpx)
dpi = calculate_dpi(wpx, hpx, diagonal_inches)
density_category = classify_density(dpi)

# Display results
print()
print("--- DISPLAY METRICS ANALYSIS ---")
print(f"Total Pixel Count : {total_pixels:,} pixels")
print(f"Aspect Ratio : {aspect_ratio}")
print(f"Calculated DPI : {dpi:.2f} DPI")
print(f"Density Category : {density_category}")
print()

if __name__ == "__main__":
    while True:
        dpi_calculator()

        # Ask if user wants to calculate another display
        another = input("Calculate another display? (yes/no): ").strip().lower()
        if another not in ['yes', 'y']:
            print("\nThank you for using the DPI Calculator!")
            break
    print()

```

Output Task 1:

The screenshot shows a Visual Studio Code editor window with a Python file named `task.py`. The script defines a `dpi_calculator()` function that calculates metrics based on user input for vertical resolution and physical diagonal size. The terminal output shows the function being executed with inputs 1080 and 24, resulting in a total pixel count of 2,073,600, an aspect ratio of 16:9, a calculated DPI of 91.79, and a density category of 'Low Density (Standard Monitor)'. The script also prompts the user to calculate another display.

```
task.py X
task.py > ...
35 def dpi_calculator():
48     # Calculate metrics
49     total_pixels = wpx * hpx
50     aspect_ratio = calculate_aspect_ratio(wpx, hpx)
51     dpi = calculate_dpi(wpx, hpx, diagonal_inches)
52     density_category = classify_density(dpi)
53
54     # Display results
55     print()
56     print("--- DISPLAY METRICS ANALYSIS ---")
57     print(f"Total Pixel Count : {total_pixels:,} pixels")
58     print(f"Aspect Ratio : {aspect_ratio}")
59     print(f"Calculated DPI : {dpi:.2f} DPI")
60     print(f"Density Category : {density_category}")
61     print()
62

Output Task 4:

Short Answer: Why does adding an Alpha channel (RGBA) increase an image array's memory consumption by 33% compared to standard RGB?

Answer: Because **RGB** has 3 channels (Red, Green, Blue), while **RGBA** has 4 channels (Red, Green, Blue + Alpha).

- RGB = 3 values per pixel
- RGBA = 4 values per pixel

So memory increases by:

$$(4 - 3) / 3 \times 100 = 33.3\%$$
